

IIFL Livlong Placement Experience

Name : Shreya Singh

Branch : Artificial Intelligence and Data Science

Linkedin : <https://www.linkedin.com/in/shreya-singh-809332232/>

Phone : 9119451557

Company status : Dream

Date of Drive : 09/08/2023, 10/08/2023

Eligible Branches : BE (CS / INFT / ETRX/ EXTC/AIDS), MCA

Eligibility Criteria : Current Aggregate CGP - 7 and above, No live KT

CTC Packages: B.Tech – 7 l.p.a + Company Variable

M.C.A. – 6 l.p.a + Company Variable

Job Description :

Technology stack:

Dot Net, Java Script, Node JS, Kotlin, Python, HTML5/CSS3, Database

Operating system – Linux, Windows

Agile Development Environment

Job Offered : Yes

Work Location : Thane (Options - Pune, Thane and Gurgaon)

Pre Placement Talk : 12:00 - 1:00 pm

The team discussed their work culture later on if we have any questions, we can ask them.

Rounds

1. Online Aptitude Test - 1.00pm to 2.30pm

(100 MCQs - Aptitude, Quants, SQL, HTML/CSS, C/C++, Java, Python)

No Coding Questions

2. Round 1 - (Time 30 - 40 mins)

- OOPS and it's 4 concepts with example
- SDLC
- Explain what an algorithm is and share some examples. Based on the examples I gave, the interviewer asked me to write code for one of those algorithms. To play it safe, I only mentioned algorithms I knew well enough to code confidently. The task was to write code for Binary Search and show how it works with a dry run. This way, I could demonstrate my coding skills without dealing with more complicated stuff like Merge Sort, where errors are more likely.
- Write a code to find the duplicates in an array
- Program for Reversing a String
- SQL -
 1. A query to find student_roll_id from 100 to 200 (I was asked to share the screen and write the query on Notepad)
 2. DDL, DML commands
 3. Aggregate Functions of SQL - sum(), count(), avg(), group by() , etc.
 4. Types of Relations in Database
 5. Theory on Joins and one basic code

6. How to copy a table using select statement

In this round, they will ask about your knowledge, focusing on questions related to your expertise. Ensure that you effectively communicate what you know. Engage in a discussion rather than solely providing answers. Confirm that the interviewer is attentive to your responses. In my case, there was considerable chaos from the interviewer's side, making the discussion crucial to gauge her level of attentiveness.

If the interview is conducted online, check with candidates who were interviewed before you and inquire about the questions they were asked. This can assist you in last-minute preparation, as there's a possibility that the same person will interview you.

Review the job description thoroughly and study all relevant topics before the interview. In my experience, they emphasised Agile development and posed questions related to software development life cycle, waterfall model, etc. Familiarise yourself with Software Engineering subjects to be well-prepared for such inquiries.

Prepare your introduction in advance, ensuring it briefly highlights your technical skills. Also, mention soft skills that would benefit the company, such as management and leadership, as they are more interested in these qualities than your school achievements.

3. Round 2 (Tech + HR) -

- Tell me about yourself, your family background.
- I was questioned about why I chose Java for Data Structures and Algorithms (DSA) instead of Python or C++. Despite my attempts to provide several reasons, the interviewer seemed unsatisfied and continued to ask, "Shreya, my question is still the same. Why Java?" In the end, I honestly shared that my decision was influenced by the advice of my seniors, who suggested that companies often prefer Java. This admission seemed to satisfy the interviewer, as it demonstrated my honesty even when I didn't have the exact answer they were looking for.
- What is Cloud Computing?
- What do you know about IIFL?
- OOPS concepts
- Write code for the number of times the letter 's' appears in my name 'Shreya Singh' and list its positions (index)

This round lasted about 30 minutes, and the interviewer was intermittently occupied with his own work for approximately 10 minutes during that time. He muted himself three times, either due to receiving a call, engaging in conversations with others in the office, etc. This created an awkward situation for me, and I struggled with how to navigate it. Throughout, I maintained a smile and attempted to appear less nervous.

During the question and answer session, I had to ensure that the interviewer was paying attention and not becoming disinterested. Given the late hour (5:30 pm, almost the last hour of office), I was mindful that he might be tired, and if I failed to engage him, it could negatively impact my chances.

To keep him interested, I engaged in a conversation-style approach, providing thoughtful and interesting answers to his questions. When he inquired about my choice of Java for DSA, we had a fruitful conversation lasting about 5 minutes, during which it seemed like he was genuinely enjoying the interview.

Realising the importance of making a lasting impression, especially towards the end of the workday, I aimed to keep the interaction lively. I made sure to ask questions about the company, the tech stack (even though it was mentioned in the JD), and other related topics. I framed my questions using phrases like "our company," "If I get placed, what tech stacks will I need to learn for the company," and "the technologies I am acquainted with will be beneficial for our company." This approach projected confidence, as if it were a given that I would be selected.

In the concluding segment, I asked him 3-4 questions, and he responded with detailed answers, indicating a genuine interest in sharing more about his(our) company.
