

JPMC PLACEMENT EXPERIENCE

Name: Rakshita Danee

Email: daneerakshita@gmail.com

Job Offered: Yes

Contact: +91 8850581655

CGPA: 9.3

CTC: 17.75 LPA

Eligibility: 7 CGPA

Company Status: Dream

Placement experience

There are majorly 3 steps in the JPMC placement process.

1. Coding test

We received an online link which had to be completed within 2 days. The software required camera access so please make sure that you have tested your laptop and that no other applications are using the camera because this will cause immediate disqualification. The questions are of Easy to Medium level and can be easily solved if you have a knack for competitive coding or have spent any time on Leetcode.

2. Interview

This automated interview has 2 questions, both of them are HR questions that want to know more about you as a person. The important thing here is to present yourself well. Make sure your answers are diplomatic and true to yourself. Sit in a clean and well lit area. Only a few people qualify for this round. So take your time and answer with poise. You get 2 attempts to record your answer after you receive the question prompt. Each answer has a timer of around 2 minutes.

3. Code for Good

This is the most challenging portion of the process, it is a 24 hour hackathon. There is an orientation held. You are assigned a team around 1 or 2 days before and 2 mentors. A group is made on Slack. Being vocal and communicative with the mentors and organizers works to your benefit. We created our own whatsapp group without the mentors and held meetings to decide the technology stack we are all familiar with, who would take what role and what would be the best approach for us to take. Always be friendly and even though this is part of a placement process, work together WITH EVERYONE do not try to do it all or be a know it all.

After this we were in constant contact, found out types of problem statements that do come and did all our research.

Then we met with the mentors before the hackathon to get to know them (this is not mandatory, not all mentors do this).

It really helps to have strong knowledge of some web development stack. I took the role of the backend developer and even added analytics to our web page with tableau. After the start of the hackathon, it's a typical process. You will have to work for the entire 24 hours. We didn't even take lunch breaks! It was a very enthralling experience. The mentors took our separate interviews. They asked Hr as well as some technical questions. We had great mentors who were very supportive and impressed with our team work.

At the end you have presentations after which you have the result declarations.

We received the result of the placement about a month later.

General suggestions:

- Make sure to have a strong resume, with enough good projects and extracurricular work.
- It always helps to have skills of one domain in stack development bonus if you build a good portfolio about it.
- Always present yourself well. Be in presentable attire and have good lighting.
- Always communicate. Whenever you are in the hackathon at any stage communicate your work and your plan
- The hackathon can be very stressful so always keep a positive attitude.

All the best!
